Harrison Williams / Builder & Coder
Lego Soccer**

Interesting Feature:

An interesting feature of our robots are the shallow ball catches. We had to resort to this due to the space we had to work with on the side of our robots. We have worked to find a design that is compact yet effective at catching the ball, which is what we have stuck with.

**What we Have Learned This Year:
We have learned in our first year of competing in soccer that calling damage can make or break your game. After calling damage at regionals as our robot was slightly broken in the final minutes, we learned that you cannot put the robot back on the field instantly. The other team managed to score with that opportunity, and we conceded the game by 1 point. This has taught us to only remove the robots for extreme damage where they could not be used.**

**Our Biggest Challenge (so far):
Our biggest challenge we have encountered and are still encountering is a feature that we have longed to have on our robots. We have seen other peoples robots move fluidly on the field, while ours is stuck moving one direction, pausing and moving again. If we had more time to improve our robots, we would try and fix that issue and make the movement more effective, therefore improving our robots significantly.**
